

## 2. Fundamentals of Octave (&MATLAB)

- Octave GUI(Graphical User Interface)
- Command Window
- Scripts
- Variables
- Matrices
- Arithmetic operations & special values
- Mathematical functions
- Input/output with files
- Loops
- Conditional branch & flow control
- Plotting grpahs

# Octave GUI

# Using Command Window

- Example: Type “1+2” and press the Enter key after the prompt “>>”

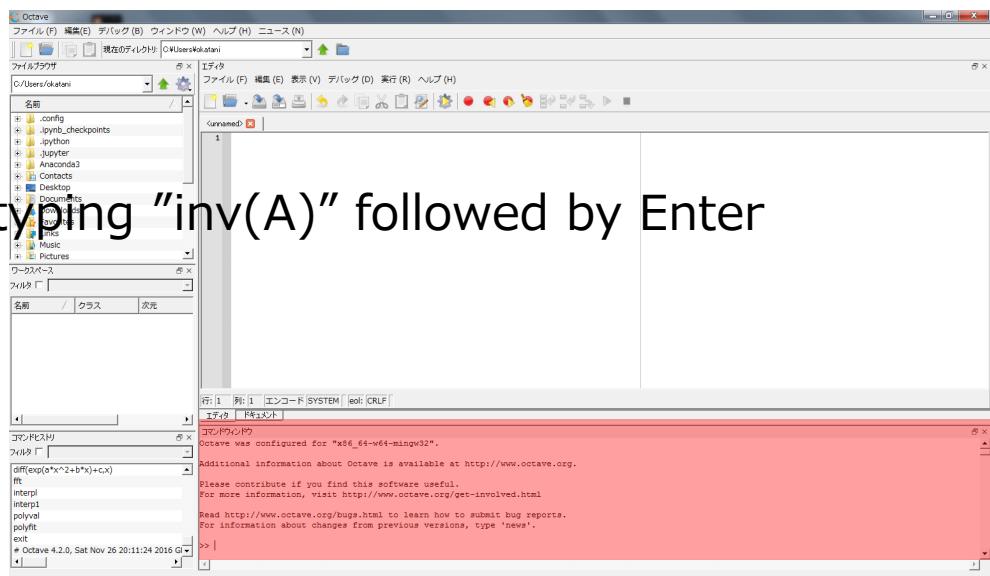

```
>> 1+2  
ans = 3  
>>
```

- You can create a 2x2 matrix A by typing as follows:

```
>> A=[1,2;3,4]  
A =  
1 2  
3 4
```

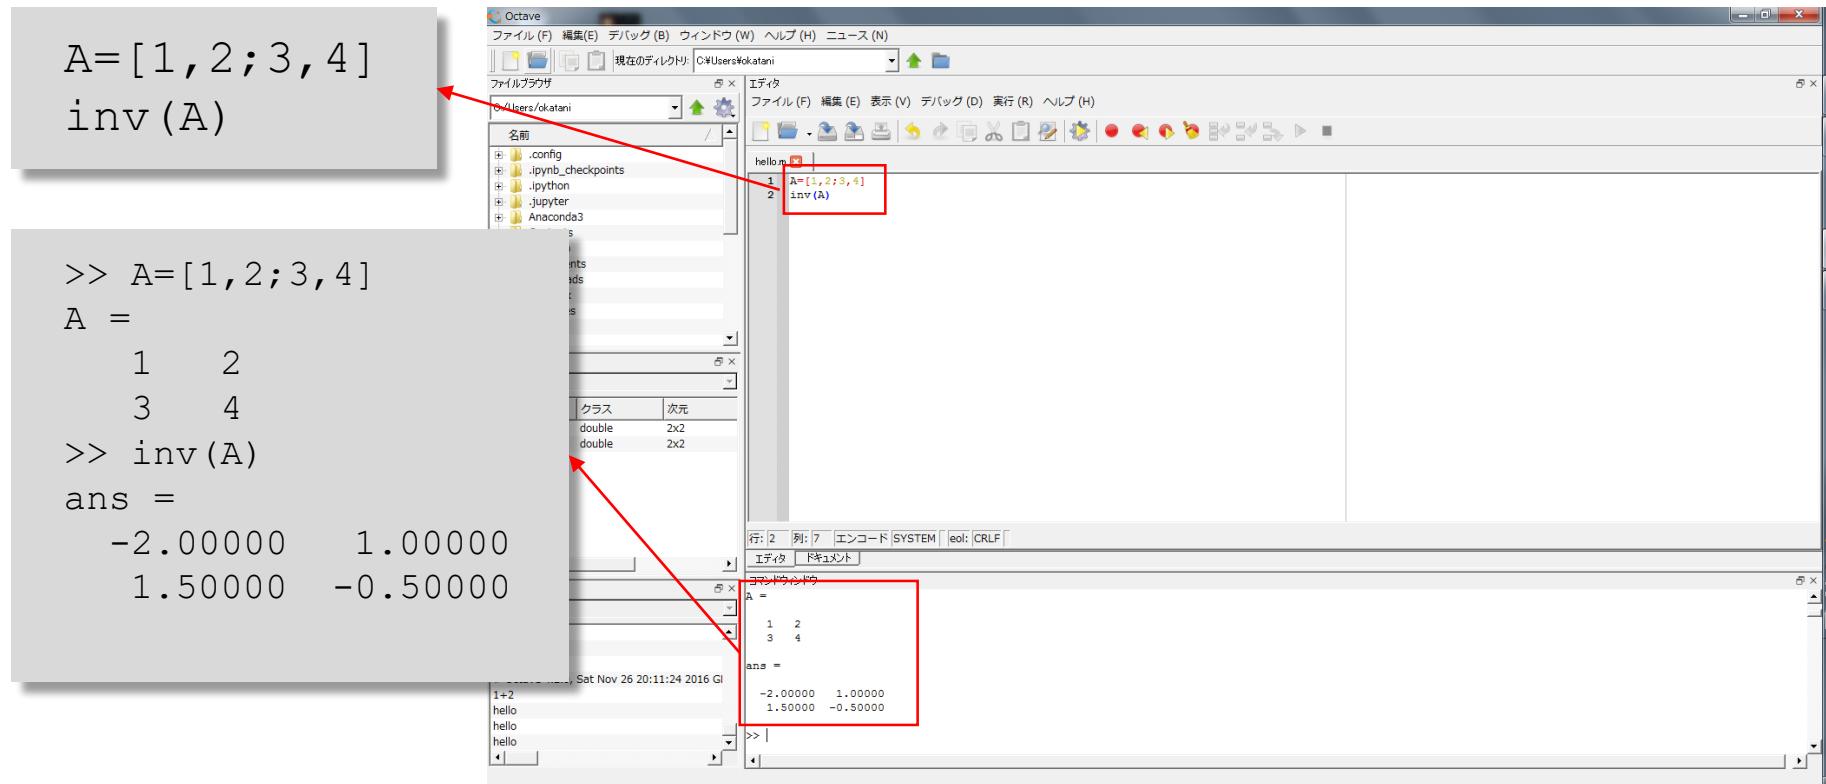

- You can calculate its inverse by typing “inv(A)” followed by Enter

```
>> inv (A)  
ans =  
-2.00000 1.00000  
1.50000 -0.50000
```

# Writing a script file

- Type as follows in the Editor window, select “Save File”-“File” in the Editor window menu, type “hello”, and click “Save”
  - The script should be saved as “hello.m”
- Type “hello” followed by Enter to run the contents
  - Same as choosing “Save File and Run”-“Run” in the menu

# Using variables

- You can create and use a variable like `A` in the earlier example
  - The name of a variable should be different from existing files and variables
  - There is no limitation in the length of variable names; it must be less than 19 characters in MATLAB, though

```
>> the_1st_variable=[1;2];
>> the_1st_variable
the_1st_variable =
1
2
```

- Numeric characters and '`_`' (underscore) can be used for variable names
- Result won't be displayed by typing ';' (semicolon) at the end

- All the variables you created so far will be displayed in Workspace
- You can remove a variable with the data by typing `clear`

```
>> clear A
```

# Using matrices

- The most fundamental data representation in Octave/Matlab
- A matrix of any size can be created by using ';' to separate elements and ';' to separates rows;

2x3 matrix

```
>> A=[1,2,3;2,3,4]
A =
    1    2    3
    2    3    4
```

3x2 matrix

```
>> B=[1,2;2,3;3,4]
B =
    1    2
    2    3
    3    4
```

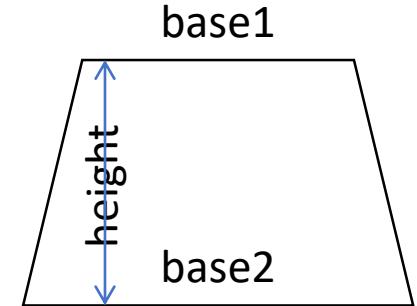

- You can get the size of a matrix using a built-in function `size`

```
>> size(A)
ans =
    2    3
>> size(B)
ans =
    3    2
```

# Arithmetic operation and special values

- Basic operators : +, -, \*, /

```
>> base1=3.0;base2=5.0;height=3.0;  
>> area=(base1+base2)*height/2  
area = 12
```

- Exponentiation : ^

```
>> 2^40  
ans = 1.0995e+12
```

- Imaginary unit : i or j

```
>> i  
ans = 0 + 1i  
>> j  
ans = 0 + 1i  
>> exp(-pi*i)  
ans = -1.0000e+00 - 1.2246e-16i
```

- $\pi$

```
>> pi  
ans = 3.1416
```

$$e^{i\pi} = -1$$

(Euler's formula)

# Mathematical functions

- Trigonometric functions
  - sin, sinh, asin, cos, cosh, acos, tan, tanh, atan, atan2
- Exponential, log functions, etc.
  - exp, log, log10, sqrt
- Various operations on matrix elements
  - sum, max, min, sort, mod
- Absolute value and complex numbers
  - abs, conj, imag, real

```
>> sin(pi/2)
ans = 1
>> sin(pi)
ans = 1.2246e-16
>> log(e)
ans = 1
```

```
>> A
A =
    1   2   3
    2   3   4
>> sum(A)
ans =
    3   5   7
>> sum(sum(A))
ans = 15
```

```
>> a=2.0-3.0j
a = 2 - 3i
>> imag(a)
ans = -3
>> real(a)
ans = 2
>> abs(-a)
ans = 3.6056
>> conj(a)
ans = 2 + 3i
```

# Input and output with files

- You can write the value of a variable into a specified file:

```
>> save('A.txt', 'A')
```

- Then read the written value from the file:

```
>> load('A.txt')  
>> A  
A =  
1 2 3  
2 3 4
```

```
>> B=load('A.txt')  
>> B.A  
ans =  
1 2 3  
2 3 4
```

- You can also save/load the whole contents of Workspace into/from a specified file

```
>> save('workspace1')
```

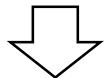

```
>> load('workspace1')
```

# Loops

- Repeat a series of commands with `for index=start:step:end ... end`

## Script

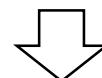

```
# loop1.m
for i=1:10
    x = 2^i;
    printf('%d: %f\n', i, x)
endfor
```

## Result

```
>> loop1
1: 2.000000
2: 4.000000
3: 8.000000
4: 16.000000
5: 32.000000
6: 64.000000
7: 128.000000
8: 256.000000
9: 512.000000
10: 1024.000000
```

```
# loop2.m
# calculate position of a vehicle
# with a constant acceleration
a = 1.0; # acceleration
for t=0.0:0.5:3 # time
    y=.5*a*t^2; # position
    printf('%f: %f\n', t, y)
endfor
```

```
>> loop2
0.000000: 0.000000
0.500000: 0.125000
1.000000: 0.500000
1.500000: 1.125000
2.000000: 2.000000
2.500000: 3.125000
3.000000: 4.500000
```

# Conditional branch & flow control

- if-elseif-else-end structure

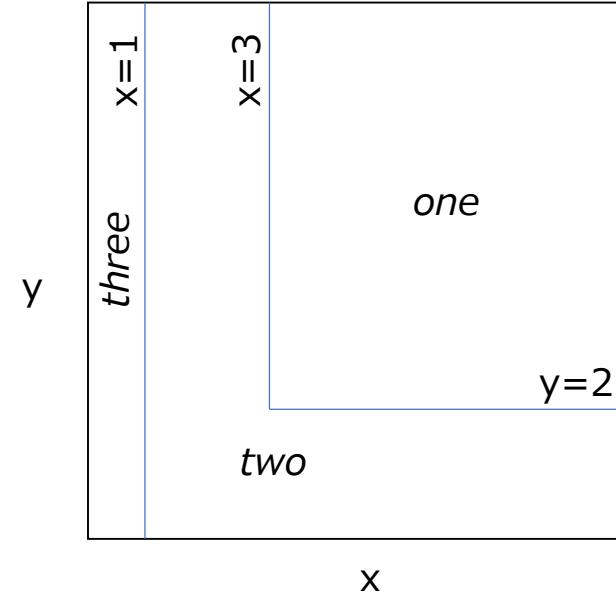

Script

```
#ifelse1.m
if x > 3.0 && y > 2.0
    disp('one')
elseif x > 1.0
    disp('two')
else
    disp('three')
endif
```

Logical AND  
(if both are true)

```
#ifelse2.m
if x < 3.0 || y < 2.0
    if x < 1.0
        disp('three')
    else
        disp('two')
    end
else
    disp('one')
endif
```

Logical OR  
(if either is true)

Results

```
>> x=4;y=5;
>> ifelse1
one
>> x=2;y=5;
>> ifelse2
two
>> x=y=0;
>> ifelse1
three
```

Comparison Operators

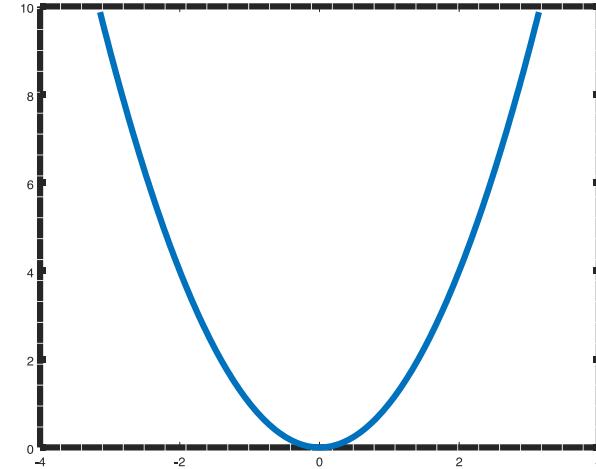

$x \leq y$	less than
$x == y$	or equal
$x \geq y$	equal
$x > y$	greater than
$x != y$	or equal
$x \neq y$	not equal

# Plotting a graph

- `plot(x, y)`, where  $x$  is a vector of length  $m$  storing  $x$  coordinates and  $y$  is a vector of the same length storing  $y$  coordinates

```
>> x=-pi:pi/100:pi;  
>> y=x.^2;  
>> plot(x, y)
```

'.<sup>^</sup>' expresses  
squaring each element

- To plot different curves in a single graph

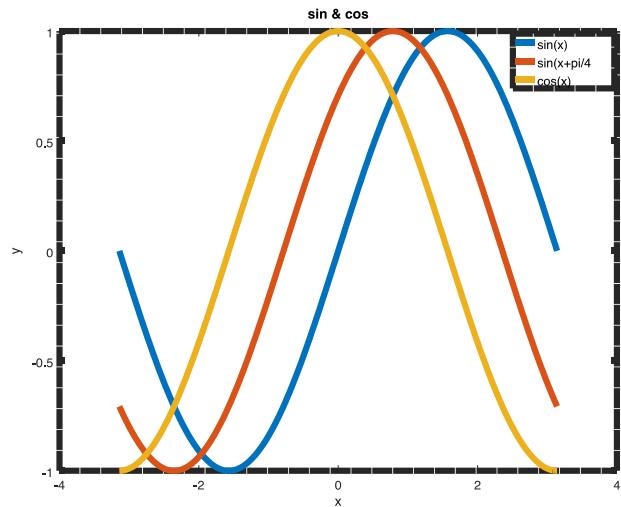

```
>> plot(x, sin(x), x, sin(x+.25*pi), x, cos(x))
```

- To set axis labels, titles, and legends

```
>> xlabel('x'), ylabel('y'), title('sin & cos')  
>> legend('sin(x)', 'sin(x+pi/4)', 'cos(x)')
```

- To change font sizes (before calling `plot`)

```
>> set(0, "defaultaxesfontsize", 20)  
>> set(0, "defaulttextfontsize", 20)
```

# Exercises 2.1 (assignments)

- Find all numbers of 3 digits such that the sum of the cubes of its digits equals the number itself; an example is 153, because  $1^3+5^3+3^3 = 153$
- Revise the script below to find these numbers

```
for i = 100:999
    i1 = mod(i, 10);
    i2 = mod(floor(i/10), 10);
    i3 = floor(i/100);
    disp([i3 i2 i1])
endfor
```

Hint: This script scans every three-digit number and gets its three digits

- Write a script that finds the same numbers in a different way by filling in the blanks below:

```
for i3 = 1:9
    for i2 = 0:9
        for i1 = 0:9
            
        endfor
    endfor
endfor
```
